

# Auto Sound Diagnosis Report

## Squealing Noise

### Diagnosis:

Persistent squealing is typically caused by worn brake pads or glazed brake rotors. It could also be due to loose belts under the hood.

### Personalized Message:

This high-pitched squeal is annoying, but it's also a warning sign you shouldn't ignore!

### Gravity Level:

High brakes are safety-critical.

### Danger Level:

High worn pads can lead to brake failure or rotor damage.

### Rough Cost Estimate:

\$100 - \$400 for pad replacement; \$300+ if rotors are also damaged.

### Next Recommended Step:

You can visually inspect brake pad thickness through the wheel openings. If pads are thin ( $< 1/4$  inch), replace them. Otherwise, have a mechanic confirm if rotors or calipers are affected.
