

Auto Sound Diagnosis Report

Clunking Noise

Diagnosis:

The clunking noise is often caused by worn or loose suspension components, such as control arms, sway bar links, or struts.

Personalized Message:

Hello! If you're hearing clunking over bumps or turns, it's a common issue we see in vehicles with aging suspension systems.

Gravity Level:

Moderate to High may affect stability.

Danger Level:

Medium risk of worsening damage or loss of control on rough roads.

Rough Cost Estimate:

\$150 - \$800 depending on which parts need replacement.

Next Recommended Step:

You can perform a visual inspection underneath the vehicle for visibly damaged or detached components. If unsure, have a mechanic lift the vehicle for a complete suspension check.
