

Buzzing Noise Diagnostic Report

1. Diagnosis:

Buzzing noises can come from:

- Fuel pump under load
- Loose interior panels vibrating
- Electrical interference in the audio system

2. Personalized Message:

Buzzing sounds can be annoying and persistent. It's great you're paying attention-they might signal something as minor as trim vibration or as serious as a failing fuel pump.

3. GRAVITY Level:

Low to Medium - Often minor, but could affect performance if related to fuel delivery.

4. DANGER Level:

Low - Not dangerous, unless connected to the fuel or electrical system.

5. Rough Cost Estimate:

- Fuel pump replacement: \$400 - \$800
- Trim adjustment or padding: \$50 - \$200

6. Next Recommended Step:

Try to locate if the buzzing comes from inside or outside. Turn off AC, radio, and idle the car. If it happens while accelerating, it might be fuel-related. Consult a technician for certainty.
